

How do I convert scanned documents to text?

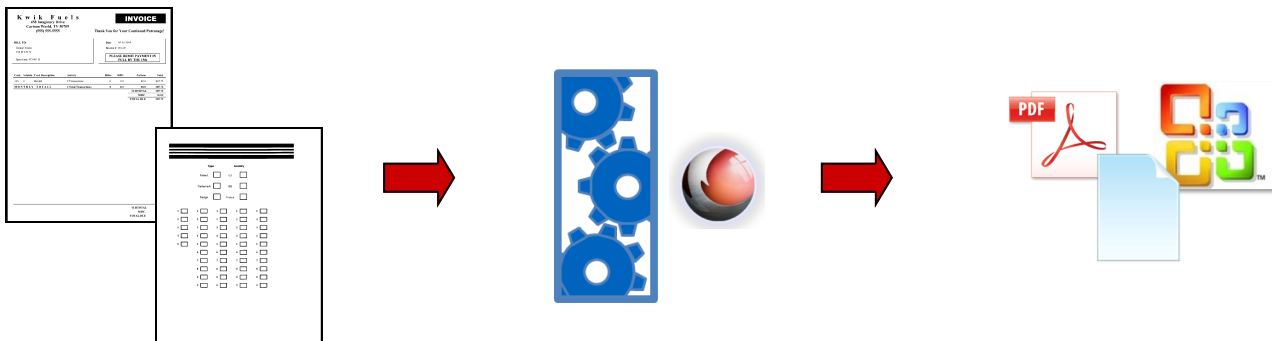

How do I read check boxes on forms?

How can I output scanned files to PDF?

One answer:

PSI:Capture OCR/PDF/OMR Module

When it comes to scanning, every organization has different requirements, and they are typically very broad. Full text search capability is almost always a necessity, and the ability to create an industry standard searchable PDF has become the norm. PSI:Capture's OCR/PDF/OMR module provides a powerful feature set that allows the conversion of images to a number of standard text formats, the ability to create PDFs, and Optical Mark Recognition (OMR), or the ability to read check boxes. Other features include: multiple language recognition, Zone OCR, PDF header field population, and much, much more.

Capture documents from direct connect scanners or import from network folders for processing.

The OCR Module converts documents to text, reads check boxes, and can analyze zones to read information.

Information from OMR and Zone OCR is mapped to fields, and text documents are produced in the specified format.

The OCR/PDF/OMR Module adds great power to any capture workflow, producing searchable output, and automating many of the manual processes required. For more information, contact your reseller or PSIGEN today.
